Notes:  
 Housing units at ECC are pre-manufactured modular units.  
 This is the legal configuration of this camp as verified by the original drawings. However, the current layout may be different in practice.

Notes:  
 The H through J Wings in Unit 4 house segregation; thus, their cells are single bunked.  
 In each of Units 7, 8, and 10 there are two beds set aside to accommodate ADA individuals, dialysis, and nursing mothers.

Male	GP

Notes:  
 Housing units at HCC are Alaskan modules, bay type.  
 In the B Wing, there is a four-person cube/bay area.

Notes:

In each wing of Units 1 through 6, one cell has been reserved for ill inmates (A beds 21 and 22). However, these cells have been progressively double bunked as the B bed was added to each medical cell. The bed configuration, therefore, was revised from 2x1 to 2x2. This change increased the total capacity of each wing from 166 to 168. Unit five has one wing divided into two types of populations. For this unit the B Bed was added to each, the West and East sides, increasing the capacity from 166 to 168.

Nevada Department of Corrections		
Definitions of Capacity		
Capacity	Definition	Room Type
Base Structure	The NDOC utilizes the Nevada Public Works Board bed capacity numbers, as designed, and these numbers do not change over time. This concept assumes that there is one inmate per bed, and capacity utilization is at no more than 100%.	◆Cells. The NDOC follows the definition established by the Public Works Board, which is one inmate per cell or single-occupied cells in a housing area.
		◆ Camps/dorms. Dormitory capacity is established by the Public Works Board during the design and construction phases. Dorm style housing areas are intended to be shared by multiple inmates
Operating Capacity	This concept assumes that every other cell houses two prisoners, on the average. The outcome is 150% utilization of the cell capacity of a given housing area. However, specialized housing units are excluded from this ratio calculation. Housing areas intended to accommodate special populations, such as segregation, mentally or medically ill, or death row inmates who are single-celled for security and safety.	
Emergency Capacity	This concept assumes that more than every other cell houses two prisoners, on the average. The outcome is more than 150% utilization of the cell capacity of a given housing area. However, specialized housing units are excluded from the base and/or total capacity and from this ratio calculation. Housing areas intended to accommodate special populations, such as segregation, mentally or medically ill, or death row inmates are single-celled for security and safety.	
Emergency Overflow	This concept assumes that more than every other cell houses two prisoners, on the average. The outcome is more than 150% utilization of the cell capacity of a given housing area. However, specialized housing units are excluded from the base and/or total capacity and from this ratio calculation. Housing areas intended to accommodate special populations, such as segregation, mentally or medically ill, or death row inmates are single-celled for security and safety.	
Total Beds	This is the sum of emergency capacity and emergency overflow beds. Total beds divided by base structure is the percentage utilization of space to bed design.
